

Course software for introductory deep learning

In the practicals, we will use only a small dataset and we will need only little computation power and memory resources. You can therefore do the practicals on various computing platforms. However, since the participants may use various types of computers and softwares, we recommend to use the UNIL JupyterLab to do the practicals.

- [JupyterLab](#): Working on the cloud is convenient because the installation of the Python and R packages is already done and you will be working with a Jupyter Notebook style even if you use R. Note, however, that the UNIL JupyterLab will only be active during the course and for one week following its completion, so in the long term you should use either your laptop or Curnagl.
- [Laptop](#): This is good if you want to work directly on your laptop, but you will need to install the required libraries on your laptop. **Warning: We will give general instructions on how to install the libraries on your laptop but it is sometimes tricky to find the right library versions and we will not be able to help you with the installation.** The installation should take about 15 minutes.
- [Curnagl](#): This is efficient if you are used to work on a cluster or if you intend to use one in the future to work on large projects. If you have an account you can work on your /scratch folder or ask us to be part of the course project but **please contact us at least a week before the course**. If you do not have an account to access the UNIL cluster Curnagl, **please contact us at least a week before the course** so that we can give you a temporary account. The installation should take about 15 minutes. Note that it is also possible to use JupyterLab on Curnagl: see <https://wiki.unil.ch/ci/books/high-performance-computing-hpc/page/jupyterlab-on-the-curnagl-cluster>

If you choose to work on the UNIL JupyterLab, then you do not need to prepare anything since all the necessary libraries will already be installed on the UNIL JupyterLab. In all cases, you will receive a guest username during the course, so you will be able to work on the UNIL JupyterLab.

Otherwise, if you prefer to work on your laptop or on Curnagl, please make sure you have a working installation before the day of the course as on the day we will be unable to provide any assistance with this.

If you have difficulties with the installation on Curnagl we can help you so please contact us before the course at helpdesk@unil.ch with subject: DCSR ML course.

On the other hand, if you are unable to install the libraries on your laptop, we will unfortunately not be able to help you (there are too many particular cases), so you will need to use the UNIL Jupyter Lab during the course.

Before the course, we will send you all the files that are needed to do the practicals.

JupyterLab

Here are some instructions for using the UNIL JupyterLab to do the practicals.

You need to be able to access the eduroam wifi with your UNIL account or via the UNIL VPN.

Go to the webpage: <https://jupyter.dcsr.unil.ch/jupyter>

Enter the login and password that you have received during the course. Due to a technical issue, you may receive a warning message "Your connection is not private". This is OK. So please proceed by clicking on the advanced button and then on "Proceed to dcsrs-jupyter.ad.unil.ch (unsafe)".

Python

Click on the "ML" square button in the Notebook panel.

Copy / paste the commands from the html practical file to the Jupyter Notebook.

To execute a command, click on "Run the selected cells and advance" (the right arrow), or SHIFT + RETURN.

When using TensorFlow, you may receive a warning

```
2022-09-22 11:01:12.232756: W tensorflow/stream_executor/platform/default/dso_loader.cc:64]
Could not load dynamic library 'libcudart.so.11.0'; dlerror: libcudart.so.11.0: cannot open shared
object file: No such file or directory
2022-09-22 11:01:12.232856: I tensorflow/stream_executor/cuda/cudart_stub.cc:29] Ignore above
cudart dlerror if you do not have a GPU set up on your machine.
```

You should not worry. By default, TensorFlow is trying to use GPUs and since there are no GPUs, it writes a warning and decides to use CPUs (which is enough for our course).

When you have finished the practicals, select File / Log out.

R

Click on the "ML R" square button in the Notebook panel.

Copy / paste the commands from the html practical file to the Jupyter Notebook.

To execute a command, click on "Run the selected cells and advance" (the right arrow), or SHIFT + RETURN.

When using TensorFlow, you may receive a warning

```
2022-09-22 11:01:12.232756: W tensorflow/stream_executor/platform/default/dso_loader.cc:64]
Could not load dynamic library 'libcudart.so.11.0'; dlerror: libcudart.so.11.0: cannot open shared
object file: No such file or directory
2022-09-22 11:01:12.232856: I tensorflow/stream_executor/cuda/cudart_stub.cc:29] Ignore above
cudart dlerror if you do not have a GPU set up on your machine.
```

You should not worry. By default, TensorFlow is trying to use GPUs and since there are no GPUs, it writes a warning and decides to use CPUs (which is enough for our course).

When you have finished the practicals, select File / Log out.

Laptop

You may need to install development tools including a C and Fortran compiler (e.g. Xcode on Mac, gcc and gfortran on Linux, Visual Studio on Windows).

Python installation

Here are some instructions for installing Keras with TensorFlow at the backend (for Python3), and other libraries, on your laptop. You need Python ≥ 3.8 .

For Linux

We will use a terminal to install the libraries.

Let us create a virtual environment. Open your terminal and type:

```
python3 -m venv mlcourse

source mlcourse/bin/activate

pip3 install tensorflow scikit-learn scikeras eli5 pandas matplotlib notebook keras-tuner
```

You may need to choose the right library versions, for example `tensorflow==2.12.0`

To check that Tensorflow was installed:

```
python3 -c "import tensorflow; print(tensorflow.version.VERSION)"
```

There might be a warning message (see above) and the output should be something like "2.12.0".

You can terminate the current session:

```
deactivate
```

```
exit
```

TO DO THE PRACTICALS (today or another day):

You can use any Python IDE (e.g. Jupyter Notebook or PyCharm), but you need to launch it after activating the virtual environment. For example, for Jupyter Notebook:

```
source mlcourse/bin/activate
```

```
jupyter notebook
```

For Mac

We will use a terminal to install the libraries.

Let us create a virtual environment. Open your terminal and type:

```
python3 -m venv mlcourse
```

```
source mlcourse/bin/activate
```

```
pip3 install tensorflow-macos==2.12.0 scikit-learn==1.2.2 scikeras eli5 pandas matplotlib  
notebook keras-tuner
```

If you receive an error message such as:

ERROR: Could not find a version that satisfies the requirement tensorflow-macos (from versions: none)

ERROR: No matching distribution found for tensorflow-macos

Then, try the following command:

```
SYSTEM_VERSION_COMPAT=0 pip3 install tensorflow-macos==2.12.0 scikit-learn==1.2.2 scikeras  
eli5 pandas matplotlib notebook keras-tuner
```

If you have a Mac with M1 or more recent chip (if you are not sure have a look at "About this Mac"), you can also install the tensorflow-metal library to accelerate training on Mac GPUs (but this is not necessary for the course):

```
pip3 install tensorflow-metal
```

To check that Tensorflow was installed:

```
python3 -c "import tensorflow; print(tensorflow.version.VERSION)"
```

There might be a warning message (see above) and the output should be something like "2.12.0".

You can terminate the current session:

```
deactivate
```

```
exit
```

TO DO THE PRACTICALS (today or another day):

You can use any Python IDE (e.g. Jupyter Notebook or PyCharm), but you need to launch it after activating the virtual environment. For example, for Jupyter Notebook:

```
source mlcourse/bin/activate
```

```
jupyter notebook
```

For Windows

If you do not have Python installed, you can use either Conda:

<https://docs.conda.io/en/latest/miniconda.html> (see the instructions here:

<https://conda.io/projects/conda/en/latest/user-guide/install/windows.html>) or Python official

installer: <https://www.python.org/downloads/windows/>

We will use a terminal to install the libraries.

Let us create a virtual environment. Open your terminal and type:

```
python3 -m venv mlcourse
```

```
source mlcourse/bin/activate
```

```
pip3 install tensorflow scikit-learn scikeras eli5 pandas matplotlib notebook keras-tuner
```

You may need to choose the right library versions, for example tensorflow==2.12.0

To check that Tensorflow was installed:

```
python -c "import tensorflow; print(tensorflow.version.VERSION)"
```

There might be a warning message (see above) and the output should be something like "2.12.0".

You can terminate the current session:

```
deactivate
```

TO DO THE PRACTICALS (today or another day):

You can use any Python IDE (e.g. Jupyter Notebook or PyCharm), but you need to launch it after activating the virtual environment. For example, for Jupyter Notebook:

```
mlcourse\Scripts\activate.bat
```

```
jupyter notebook
```

R installation

Here are some instructions for installing Keras with TensorFlow at the backend, and other libraries, on your laptop. The R keras is actually an interface to the Python Keras. In simple terms, this means that the keras R package allows you to enjoy the benefit of R programming while having access to the capabilities of the Python Keras package.

You need R ≥ 4.0 and Python ≥ 3.8 .

REMARK: The R libraries will be installed in your home directory. To allow it, you must answer yes to the questions:

Would you like to use a personal library instead? (yes/No/cancel) yes

Would you like to create a personal library to install packages into? (yes/No/cancel) yes

And select Switzerland for the CRAN mirror.

For Mac, Windows and Linux

Run the following commands on your terminal:

```
cd ~
```

```
ls .virtualenvs
```

```
# Create this directory only if you receive an error message
# saying that this directory does not exist
mkdir .virtualenvs
```

Then

```
cd ~/.virtualenvs

python3 -m venv r-reticulate

source r-reticulate/bin/activate

# For Windows and Linux
pip3 install tensorflow scikit-learn scikeras eli5 pandas matplotlib notebook keras-tuner

# For Mac
pip3 install tensorflow-macos==2.12.0 scikit-learn==1.2.2 scikeras eli5 pandas matplotlib
notebook keras-tuner

deactivate
```

You must name the environment 'r-reticulate' as otherwise it wont be able to find it.

You may need to choose the right library versions, for example tensorflow==2.12.0

Run R in your terminal and type

```
install.packages("keras")

install.packages("reticulate")

install.packages("ggplot2")

install.packages("ggfortify")
```

To check that Keras was properly installed:

```
library(keras)

library(tensorflow)

is_keras_available(version = NULL)
```

There might be a warning message (see above) and the output should be something like "TRUE".

You can terminate the current R session:

```
q()
```

Save workspace image? [y/n/c]: n

TO DO THE PRACTICALS (today or another day):

Then you can either run R in your terminal or launch RStudio.

Curnagl

For the practicals, it will be convenient to be able to copy/paste text from a web page to the terminal on Curnagl. So please make sure you can do it before the course. You also need to make sure that your terminal has a X server.

For Mac users, download and install XQuartz (X server): <https://www.xquartz.org/>

For Windows users, download and install MobaXterm terminal (which includes a X server). Click on the "Installer edition" button on the following webpage: <https://mobaxterm.mobatek.net/download-home-edition.html>

For Linux users, you do not need to install anything.

When testing if TensorFlow was properly installed (see below) you may receive a warning

```
2022-03-16 12:15:00.564218: W tensorflow/stream_executor/platform/default/dso_loader.cc:64]
Could not load dynamic library 'libcudart.so.11.0'; dlerror: libcudart.so.11.0: cannot open shared
object file: No such file or directory; LD_LIBRARY_PATH:
/dcsrsoft/spack/hetre/v1.2/spack/opt/spack/linux-rhel8-zen2/gcc-9.3.0/python-3.8.8-
tb3aceqq5wzx4kr5m7s5m4kzh4kxi3ex/lib:/dcsrsoft/spack/hetre/v1.2/spack/opt/spack/linux-rhel8-

zen/gcc-8.3.1/gcc-9.3.0-nwqdwvso3jf3fgygezygmtty6hvydale/lib  
2022-03-16 12:15:00.564262: I tensorflow/stream_executor/cuda/cudart_stub.cc:29] Ignore above  
cudart dlerror if you do not have a GPU set up on your machine.
```

You should not worry. By default, TensorFlow is trying to use GPUs and since there are no GPUs, it writes a warning and decides to use CPUs (which is enough for our course).

Python installation

Here are some instructions for installing Keras with TensorFlow at the backend (for Python3), and other libraries, on the UNIL cluster called Curnagl. Open a terminal on your laptop and type (if you are located outside the UNIL you will need to activate the UNIL VPN):

```
ssh -Y < my unil username >@curnagl.dcsr.unil.ch
```

Here and in what follows we added the brackets < > to emphasize the username, but you should not write them in the command. Enter your UNIL password.

For Windows users with the MobaXterm terminal: Launch MobaXterm, click on Start local terminal and type the command `ssh -Y < my unil username >@curnagl.dcsr.unil.ch`. Enter your UNIL password. Then you should be on Curnagl. Alternatively, launch MobaXterm, click on the session icon and then click on the SSH icon. Fill in: remote host = `curnagl.dcsr.unil.ch`, specify username = `< my unil username >`. Finally, click ok, enter your password. If you have the question "do you want to save password ?" Say No if your are not sure. Then you should be on Curnagl.

See also the documentation: <https://wiki.unil.ch/ci/books/high-performance-computing-hpc/page/ssh-connection-to-dcsr-cluster>

```
cd /scratch/< my unil username >  
  
or  
  
cd /work/TRAINING/UNIL/CTR/rfabbret/cours_hpc  
mkdir < my unil username >  
cd < my unil username >
```

For convenience, you will install the libraries from the frontal node to do the practicals. Note however that it is normally recommended to install libraries from the interactive partition by using (Sinteractive -m 4G -c 1).

```
git clone https://c4science.ch/source/DL_INTRO.git
```

```
module load python/3.10.13

python -m venv mlcourse

source mlcourse/bin/activate

pip install -r DL_INTRO/requirements.txt
```

To check that TensorFlow was installed:

```
python -c 'import tensorflow; print(tensorflow.version.VERSION)'
```

There might be a warning message (see above) and the output should be something like "2.9.2".

You can terminate the current session:

```
deactivate

exit
```

TO DO THE PRACTICALS (today or another day):

```
ssh -Y < my unil username >@curnagl.dcsr.unil.ch

cd /scratch/< my unil username >

or

cd /work/TRAINING/UNIL/CTR/rfabbret/cours_hpc/< my unil username >
```

For convenience, you will work directly on the frontal node to do the practicals. Note however that it is normally not allowed to work directly on the frontal node, and you should use (Sinteractive -m 4G -c 1).

```
module load gcc python/3.10.13

source mlcourse/bin/activate

python
```

R installation

Here are some instructions for installing Keras with TensorFlow at the backend, and other libraries, on the UNIL cluster called Curnagl. The R keras is actually an interface to the Python Keras. In simple terms, this means that the keras R package allows you to enjoy the benefit of R programming while having access to the capabilities of the Python Keras package. Open a terminal on your laptop and type (if you are located outside the UNIL you will need to activate the UNIL VPN):

```
ssh -Y < my unil username >@curnagl.dcsr.unil.ch
```

Here and in what follows we added the brackets < > to emphasize the username, but you should not write them in the command. Enter your UNIL password.

For Windows users with the MobaXterm terminal: Launch MobaXterm, click on Start local terminal and type the command `ssh -Y < my unil username >@curnagl.dcsr.unil.ch`. Enter your UNIL password. Then you should be on Curnagl. Alternatively, launch MobaXterm, click on the session icon and then click on the SSH icon. Fill in: remote host = `curnagl.dcsr.unil.ch`, specify username = `< my unil username >`. Finally, click ok, enter your password. If you have the question “do you want to save password ?” Say No if your are not sure. Then you should be on Curnagl.

See also the documentation: <https://wiki.unil.ch/ci/books/high-performance-computing-hpc/page/ssh-connection-to-dcsr-cluster>

```
cd ~

module load python/3.10.13 r-light/4.4.1

git clone https://c4science.ch/source/DL_INTRO.git

cd ~/.virtualenvs

python -m venv r-reticulate

source r-reticulate/bin/activate

pip install -r ~/DL_INTRO/requirements.txt
```

For convenience, you will install the libraries from the frontal node to do the practicals. Note however that it is normally recommended to install libraries from the interactive partition by using (Sinteractive -m 4G -c 1).

REMARK: The R libraries will be installed in your home directory. To allow it, you must answer yes to the questions:

Would you like to use a personal library instead? (yes/No/cancel) yes

Would you like to create a personal library to install packages into? (yes/No/cancel) yes

And select Switzerland for the CRAN mirror.

```
R

install.packages("keras")

install.packages("ggplot2")

install.packages("ggfortify")
```

To check that Keras was properly installed:

```
library(keras)

library(tensorflow)

is_keras_available(version = NULL)
```

There might be a warning message (see above) and the output should be something like "TRUE".

You can terminate the current R session:

```
q()
```

Save workspace image? [y/n/c]: n

TO DO THE PRACTICALS (today or another day):

```
ssh -Y < my unil username >@curnagl.dcsr.unil.ch
```

For convenience, you will work directly on the frontal node to do the practicals. Note however that it is normally not allowed to work directly on the frontal node, and you should use (Sinteractive -m 4G -c 1).

```
cd ~

module load python/3.10.13 r-light/4.4.1

R
```
